About us

TQM Itaca Technology srl is a consolidated reality in the measurement and SPC panorama: it began its activity in 1989, with a different structure, and it's able to provide customers with measuring systems for off-line SPC controls and post-process 100% inspection.

TQM Itaca Technology's SPC systems include standard or custom gauges, proprietary software (benefiting from years of experience in collaboration with our customers), standard hardware (PCs, PLC, etc...) and special hardware like interfacing boards internally developed to guarantee their performances.

TQM Itaca Technology's products can be used in any manufacturing industry. We have accumulated considerable experience over the years, especially dynamic geometrical controls in the following sectors: automotive, electric motors, various components and general mechanics etc... The SPC systems can work both locally and on the network.

TQM Itaca Technology has gained a wide experience in network management for quality data collection from different measuring devices, and it has developed a complete range of software products called "Suite Itastat" for the complete management of measuring data.

Measuring is fundamental in order to keep the production process under control, correctly interpret incoming data from measurement systems, reduce rejects and downtime costs and generally understand what is being produced and how.

In 2013, in order to guarantee a better service, TQM Itaca Technology obtained the ISO 9001:2008 certification for the design, implementation, installation and assistance of control systems for the mechanical industry with the Lloyd's Register Quality Assurance.

TQM Itaca Technology srl provides extremely valid support to customers in the form of consultancy, personnel training, design of dedicated gauges, software customisation and after-sales support.
